feedback in our open-ended feedback question expressed any concern with the concepts, wording, or logic of the time horizons question. While the feedback offered interesting additional context (for instance, respondents clarified that they were thinking of voters in their own community, rather than voters in general), we have no reason to believe, based on the feedback, that respondents misunderstood or were confused by the question. Finally, as we show in figure 1, the overall distribution of responses to the time horizons question among American politicians was similar to the distribution among Canadian politicians, providing further reassurance that responses are non-random and measure a meaningful belief among elected politicians. Taken together, these indicators suggest, at minimum, that our question was well understood by respondents and that they engaged with it meaningfully in both Canada and the United States.
